Signpost
Persistent names to reach moving targets

1 What is Signpost?
Signpost is a minimal architecture. It allows your devices to connect by resolving domain names, irrespective of network location.

2 How does Signpost work?
Users have their own domain names.
Signpost uses DNSSEC for naming and signalling.
Each Signpost uses its tactic engine to get through middleboxes and maintain reliable connections while you are on the go.

3 Why is Signpost cool?

Mobility  Security  Scalability  Identity
